

## TANDsoft Introduces Blazing Fast *FS Backup & Restore*

Innovative TANDsoft Inc. is at it again with a new product developed specifically for a customer problem overheard at Boot Camp. Introducing *FS Backup & Restore*. It addresses the needs of NonStop customers whose hours-long backups are creating troublesome challenges within their processing environments.

FS Backup & Restore is efficient and blazing fast. It sends only changed data blocks to the HPE Backup program, whose inputs normally are whole files from disk. The result? Backup times that formerly would take hours now are reduced to minutes.

Here's an example. A company must perform daily backups to tape in order to satisfy industry regulations. Every day, whole files are backed up, including any changes or modifications made to the files. This may take hours, with additional time required if data growth takes place. However, with FS Backup & Restore, only the changed data blocks are backed up on following days. Backup times are reduced significantly, and the subsequent weekly and monthly tape backups require far less processing time.

FS Backup & Restore supports Guardian Enscribe, SQL/MP tables, and OSS files. It can be installed without the need for any application modifications.

In addition to the new FS Backup & Restore, TANDsoft's solutions include the OPTA2000 virtual clock- and time-zone simulator; FileSync for automatic file synchronization, replication, and data deduplication; and Sensitive Data Intercept (SDI) for protecting and masking sensitive data-at-rest in Enscribe, SQL/MP, and SQL/MX databases. All are easy to install, easy to use, and are backed by exceptional support. They are certified on NonStop X, vNonStop, and all other NonStop servers.
